Before use

Make sure you unzip the parent folder (the one with the unit code followed by the letter E) before uploading these files, to ensure they work correctly.

SCORM package

The SCORM file is the zip file in the folder.

The SCORM package can be used in any compatible LMS, including Moodle, as well as uploaded into a SCORM editing application.

You will need to create the activities using the editing functions in your LMS or SCORM editing application using the included Assessor Workbook (this contains all of the questions and answers).

If you upload the SCORM package, the pages will upload as placeholders for the activities to show you where the activities fit into the unit. Be aware that the placeholder activities that upload with the SCORM package are not functioning activities, just text pages.

Moodle backup file

The Moodle backup is the one with the .mbz suffix.

The Moodle backup file is the best package to use if you're using a Moodle-based LMS – it will upload all of the course contents and activities, with the activities already set up in a functioning state (as opposed to just text pages).

However, it cannot be used outside of Moodle-based LMS.

To upload a Moodle backup file, log in as your admin user and navigate to 'restore a course'. Then, select the file in this package and 'restore' the course into Moodle. It will upload in sequence with everything functioning, and you can then edit as you wish using Moodle's editing functions.
